## Avery template 5160 for mac pages

Support Communities/iWork/Pages for Mac Announcement: macOS Big Sur here macOS Big Sur elevates the most advanced desktop operating system in the world to a new level of power and beauty. Update now and join the conversation here in the community. No one seems to have responded in a while. Simply ask a new question to start the conversation again. Q: Q: How to Create 5160 Mailing Labels on Pages Posted on July 28, 2015 6:06 Pm Answer I've had this question too (128) I have this question too Me too (128) I also have Page content loaded July 28, 2015 8:31 in response to chanfromd&#39;ville In response chanfromd&#39;ville Personal mailing labels repeated n times or a list of different names output mailing labels? Pages v5 doesn't have a built-in mail merge feature. Your own personalized labels have three options: Avery Design & Print Online. Enter 5160.Avery Design & Print Download for Mac. (Works with Yosemite 10.10.4) You must create an account. Automatically downloads Design-Print.1.5.0.app.zip (as of today)Double-click on this file in the Downloads folder to unpackDupla click to start the installation processAll installed applications / Design& Print.appFirst launch application will need to click the open button due to OS X securityWeb-aware application. Mail/Data Merge is suitable. Enter 5160 and offered pre-designed options that allow you to hang up the decoration. Download a free 15160 template (works for mac and PC) for use in PagesThis template is a table layout. There may also be a tab between cells. On the Pages tab, on the Text tab in the Table panel, type the content. LaboriousA variety of names, you can use the mail merge function from above, or the OS X Contacts application mailing label supports the Print panel, where you can select 5160. Assumes that you have imported a comma-separated (csv) file into a new contact group, and this information will guide you to fill out the label page. To import csv, you can import by using the import specified in the Contact Help lookup window, and then by selecting Export and Import Contacts. Or this Apple article to import Yosemite contacts. July 28, 2015 8:31 AM Answer Useful Topic Response - additional options User profile for the user: chanfromd&#39;ville Question: Q: how to create 5160 mailing labels on pages A gripe will hear pages '09. Apple's otherwise excellent word processor and page layout application, is that it provides little support for printing labels. While Pages doesn't have built-in tag templates, pages make it easy to create and use standard tags. Check the Avery website to see if there are prebuilt tag templates for use with Apple Pages. Sometimes you get lucky, that you already know that you can download a number of Microsoft Word templates for the most common labels directly from avery label. You can open a Word template in Pages, but often to set the measurements to a small extent so that the templates work. (If you decide to take this route, skip to step 6.) Avery now offers a limited selection of downloads templates in a page format as well. But often we find that there are no downloadable templates for the tag you want to use. That's when you create the label from scratch. Look at the tags to find the measurements. You can use this information to create the template from scratch. Labels without templates typically have measurement data that you can use to manually create the tag. For the purposes of this exercise, we will use information that is provided with Staples-branded Big Tabs 8 page folder separators, but can replace any number with the labels you want to use. Search the package for measurement information or use a ruler to make measurements from the label. You will use this information to create the template. It will be easier to fine-tune the label layout by opening two Inspector windows, one for document settings and the other for table settings, and the label document you are working on. To create your own template, start Pages (a /Applications) and create a new, blank word processing document. After you view the blank document, open two supervisors, first choose Show & Inspector, and then & View New Inspector. You can set one to display document settings and the other to display table settings. When you're done, the workspace should look similar to the image above. When you're done changing the layout of your document, Document Inspector should look like this. You can use the document inspector to change the layout of the document based on information from the measurements found. Be sure to remove checks from the Headers and Footers check box because headers and footers limit the amount of printable space available on the page. Set header to zero in the Headers and Footer section of the Table Inspector. Then add a new table to your document by using the Table button on the Toolbar. (Alternatively, you can add a table by using the Insert -& Table menu.) By default, Pages inserts a table of three or three people with a single header row. You'll need to change this by using Desktop Inspector. Select the table, and then in Inspector, change the body rows and columns to reflect the labels you use — 20 body rows and 2 body columns. (The Number Across and Number Down fields in the 8 tab tag templates provide the information you need for the table.) Then click each button under Header & Footer, and then click zero. Now change the column width to 1.5 inches and row height to 0.5 inches. note that the column width field changes the number to only 1.49 inches. We'll figure it out in a minute. You don't want each table to automatically resize when you add too much text, so clear the Automatically resize to content check box. check box. cell background, and then select None. After you make changes, table and document inspectors should look like this. You'll notice that even though we've provided the information exactly as it's included in the measurements on the labels packaging, the labels don't fit on a single page. To resolve this issue, you must change the bottom margin and use Document Inspector (not the tablet inspector) to change it to 0.4 inches. When you're done, print the template so that the table lines remain visible and hold it to the light behind one of the labels so that you can compare the template lines to the actual rows in the label. For this template, after looking at the label in the light, you must make other minor changes. In this case, I changed the left margin to 2.75 inches; right margin up to 2.73 inches; top margin 0.49 inches; and the bottom margin is 0.4 inches. After these changes I could change the column width to 1.5 inches. Adjustments are less of a matter of science than a question of judgment. I recommend making minor changes, 0.1 inches here is 0.05 inches, and remember that the Edit -& Undo menu is your friend. When the labels are finished and printed, you get something that looks like this. If you are satisfied with the template, use Table Inspector to remove cell borders from the table. First, select the table. (One way to do this is to click the table and select Select All.) Then choose None from the Table Inspector cell borders menu. If you're happy with your work, save the new tag as a Pages template so you can use it again in the future (File -& Save as template). You are now ready to print your labels.
